

Food Grade Valve and Disposable Ring Cutter

Remove the 2" screw cap from the bottom 2" flange of the bag liner. **Screw this same 2" cap into the outbound side of the food grade valve.**

Turn the food grade valve to the closed position as shown. Install the 2" cap into the outbound side of the valve to keep the valve clean and threads protected during installation.

Take disposable cutter out of the evacuation fitment and turn the cutter around so teeth are facing the membrane. Gently reinsert the cutter into the 2" evacuation fitment.

Thread the food grade valve assembly into the bottom 2" evacuation fitment. As the valve assembly is threaded into place, the increased thread engagement will cause the disposable cutter to pierce the membrane. **NOTE: It is very important to thread in the valve assembly all the way to make sure the o-ring is seated and sealed against the evacuation fitment.**

Valve is closed and ready to connect to outbound couplings to drain the liquid contents. **Note: Support valve assembly at all times and keep protected from trauma and or abuse.**
